

Selecting berry crop varieties for Central Oregon

A.J. Detweiler and B. Strik

Several kinds of berry crops can be grown successfully in Central Oregon. The key is to select varieties suited to local growing conditions and follow recommendations for planting and care. See the resources in “For more information,” page 3.

A typical growing season in Central Oregon ranges from 70 to 100 days, depending on location. (See *Central Oregon Climate and How it Relates to Gardening* in “Other resources,” page 4.) Frost can occur at any time of the year in this region, including when berry plants are flowering or setting fruit—with possible damage to potential crops. Although a plant may grow well, fruit production may still vary from year to year. At lower elevations, the milder climate generally increases the chance of producing a successful fruit crop.

Berry crop varieties

Many berry crops are successful in Central Oregon, especially raspberries, strawberries, gooseberries, currants, and serviceberries. You also might try cold-hardy, early-season varieties of table grapes, blueberries, and blackberries.

Tips for growing berry crops

The following suggestions can help increase your chances of fruit production.

- Select cold-hardy, short-season varieties.
- Select a site with full sun and well-drained soil.
- Select a high spot with good air flow to reduce the risk of frost damage.
- Remove all weeds from the site before planting.
- If necessary, protect plants from the elements in mid- to late-spring and early summer by covering them with row cover (frost cloth).

Strawberries (*Fragaria species*)

Choose a site with about 8 hours of sun each day. Most commercial strawberry producers in Oregon grow June-bearing varieties for their high quality and productivity. In addition to these, home gardeners often choose

day-neutral or “everbearing” types. These varieties produce fruit throughout the summer, although yield and fruit quality may be lower than with the June-bearing types. Varieties that perform well in the Willamette Valley might not perform well in Central Oregon, because they often lack sufficient cold-hardiness. Covering plants with straw mulch may offer some winter protection and prevent bud break from occurring too early in spring.

Strawberries are self-fertile. (Only one variety is needed for fruit production.)

Raspberries and blackberries (*Rubus species*)

Most raspberry and blackberry plants reach maturity and produce fruit 2 years after planting. They generally produce for 8 to 10 years.

In Central Oregon, raspberry plants perform well, and blackberry plants are marginally successful. Primocane-fruited raspberries, which bear a crop of new canes in late summer to fall, work well in cold-climate areas. Generally, if these canes are left to overwinter, they will bear another crop in early summer the next year. However, in cold areas, it’s best to cut the canes to the ground in late winter.

Although this prevents production of the early-summer crop the following year, new canes will emerge the following spring and produce a crop in late summer or fall.

Raspberries and blackberries are self-fertile.

Gooseberries and currants (*Ribes* species)

Unlike most fruit crops, gooseberries and currants will produce fruit in partial or light shade. Choose a variety that is resistant to powdery mildew. In the case of black currants, also look for resistance to white-pine blister rust. Most gooseberry and currant plants are self-fertile, unless specifically mentioned otherwise in catalog descriptions.

Saskatoons (*Amelanchier alnifolia*)

Saskatoons (also known as serviceberries, Juneberries, or mountain blueberries) produce a berry that can be eaten fresh or used to make jelly, jam, syrup, and wine. Like blueberries, this fruit is rich in antioxidants. It is sometimes called “Canada’s blueberry” because of extensive cultivation there. Saskatoon is also grown ornamentally for its attractive white flower and orange-to-red fall color.

When grown for fruit, these plants prefer full sun and moist, well-drained soil. Harvest saskatoons when the fruit changes from pink to dark purple. Many birds love this fruit, so consider covering your plants with netting to prevent birds from eating all of your crop.

Plants are self-fertile and bear fruit after 2 to 4 years (depending on their age when planted). Full production occurs after 7 to 11 years. Fruit are borne on the previous year’s growth. The varieties listed in the chart on this page have large, high-quality fruit.

Fruit	Recommended varieties
Strawberries	June-bearing (1 crop): Allstar, Clancy, Earliglow, Jewel, Honeoye, Lateglow Everbearing (2 crops, less yield): Fort Laramie, Quinault Day-neutral (continual crop): Fern, Hecker, Selva, Tribute, Tristar
Raspberries	Summer-bearing, red raspberries: Algonquin, Boyne, Canby, Encore, Haida, Killarney, Latham, Nova, Skeena, Titan Primocane-fruiting (bears on new canes in late summer): Red— Amity, Autumn Bliss, Caroline, Heritage, Summit Yellow— Anne, Fallgold Black raspberries— Bristol, Cumberland, Jewel Purple raspberries— Brandywine, Royalty
Blackberries	Chester (thornless), Illini Hardy (thorny), Triple Crown (thornless)
Gooseberries	Red: Captivator, Hinomaki Red, Pixwell, Poorman, Welcome White/Yellow: Malling Invicta, Hinomaki Yellow, Oregon Champion
Currants	Black: Ben Sarek, Titania Red: Cherry Red, Jonkeer Van Tets, Perfection, Red Lake, Rovada, Wilder White: Primus, White Imperial
Saskatoons	Honeywood, Northline, Pembina, Smokey, Thiessen
Blueberries	Highbush cultivars: Bluecrop, Blueray, Jersey, Patriot Half-high cultivars: Northblue, Northcountry, Northland, Northsky
Grapes—American and hybrids (hardy)	Blue/Black: Fredonia, Valient, Venus (seedless) Red: Canadice (seedless), Reliance (seedless), Vanessa (seedless) White/Yellow: Himrod (seedless), Lakemont (seedless), Niagara

Blueberries (*Vaccinium* species)

Blueberry plants require well-drained, acid soil (pH from 4.2 to 5.5) with relatively high organic matter. Soils in Central Oregon are not naturally acidic; our soils tend to be neutral to alkaline (pH of 7.0 or higher).

You may want to have your soil tested for pH. If the pH is above 5.5, reduce it by adding elemental sulfur 1 to 2 years before planting. Check the soil pH of your planting area or container every 1 or 2 years, as use of alkaline irrigation water will cause pH to rise.

Before planting, till in an 8- to 10-inch-deep layer of compost. Keep the planting area evenly moist, as blueberry plants do not perform well in droughtlike or overly wet environments.

Given our native soil conditions, it may be best to grow blueberries in containers, where management of soil pH may be simpler. Compact blueberry types, called “half-high,” are very well-suited to container production. In very cold-winter areas, protect roots against extreme temperatures by bringing containers into a protected area or sinking them into the ground through winter. Blueberry plants require cross-pollination by a different variety to set big berries, so plant more than one variety.

Table grapes (*Vitis species*)

American table grapes and their hybrids are best suited for cold climates; European grape varieties are less cold-hardy. Grapes prefer full sun and are relatively drought tolerant, although irrigation is required in most parts of Central Oregon.
