PESTICIDE DRIFT MANAGEMENT

Wind Drift
- Wind carries drift into noncrop areas
- Spray in a light breeze, reduce boom height, and leave an offset

Thermal Drift
- Do not spray in hot, dry conditions
- Spray before heat builds and humidity falls

Inversion Drift
- Do not spray in inversion conditions
- Spray in a light breeze
Wind carries drift into noncrop areas
- Never spray when wind speeds exceed 9 mph.
- Check nozzle output frequently to maintain calibration, and replace worn nozzles.
- Maintain proper nozzle spacing, boom height, and boom suspension to minimize causes of drift.

Spray in a light breeze, reduce boom height, and leave an offset
- Spray at wind speeds of 2-9 mph and at temperatures of less than 70°F.
- With boom sprayers:
  - Minimize boom height by using correct nozzle spacing.
  - Moderate ground speed to avoid boom wobble and bounce.
  - Adjust flow rates and pressures to the middle range for the nozzle.
- On marginal days, use an offset to protect sensitive downwind sites.

Do not spray in hot, dry conditions
- Spray drops evaporate rapidly, particularly above 70°F and when humidity is less than 40 percent.
- Drops become so small they fail to land on the crop and drift away.

Spray before heat builds and humidity falls
- Use weather forecasts and spray in cooler conditions.
- With air-blast sprayers:
  - Adjust nozzles to target the tree.
  - Turn off sprayer at row ends when turning.
  - Spray inwards in outer rows.
  - Moderate ground speed, nozzle flow rates, and air speeds.
- Use unsprayed offsets and buffers to protect sensitive downwind sites.

Do not spray in inversion conditions
- Clouds of spray drift may remain buoyant and mobile in light breezes when there is an inversion.
- They can move large distances away from the spray site.
- Avoid cool, stable conditions with low surface mixing.

Spray in a light breeze
- Spray at wind speeds of 2-9 mph to enable surface mixing that carries the spray cloud into the crop canopy.
- On marginal days, increase drop size by moderating nozzle pressures and flow rates.
